

# I gave my inbox to an AI that can't write.

60 customer emails. 180 decisions. \$0.0013 for the lot.

Cancel. Just cancel. I'm done.

CANCEL 1.00

I was charged twice for my September invoice.

BILLING 1.00

Wow, another outage. Love paying for this.

TECHNICAL 0.99

FIRST, WHAT'S A DECISION MODEL?

# A chatbot answers in words. Jev answers in numbers.

ASK A CHATBOT: "IS THIS CUSTOMER ABOUT TO LEAVE?"

"Based on the tone of the message, it seems the customer may be somewhat frustrated, which could suggest..."

ASK JEV THE SAME THING

**0.87** chance it's true. Your code can act on that straight away.

## PICK ONE

Which team should handle this?

## YES / NO

Is this customer about to leave?

## SCORE

How urgent is it, on a 0–3 scale?

Jev by TypeSafe AI, released 15 Sept 2026. \$0.042 per million input tokens. The answers are free.

THE SETUP

# 60 realistic emails to a software company. I labelled every one.

13

BILLING

14

TECHNICAL

14

SALES

11

CANCEL

8

SPAM

Some were deliberately hard: sarcasm, threats to leave, and two requests in one email.

PICK ONE

Which team should handle it?

YES / NO

Is this customer about to leave?

SCORE 0-3

How fast does it need a reply?

## THE RESULTS

# Fast, cheap and mostly right.

---

**93%**

sent to the right team  
(56 of 60 emails)

---

**0.34s**

typical time per email, for  
all three questions

---

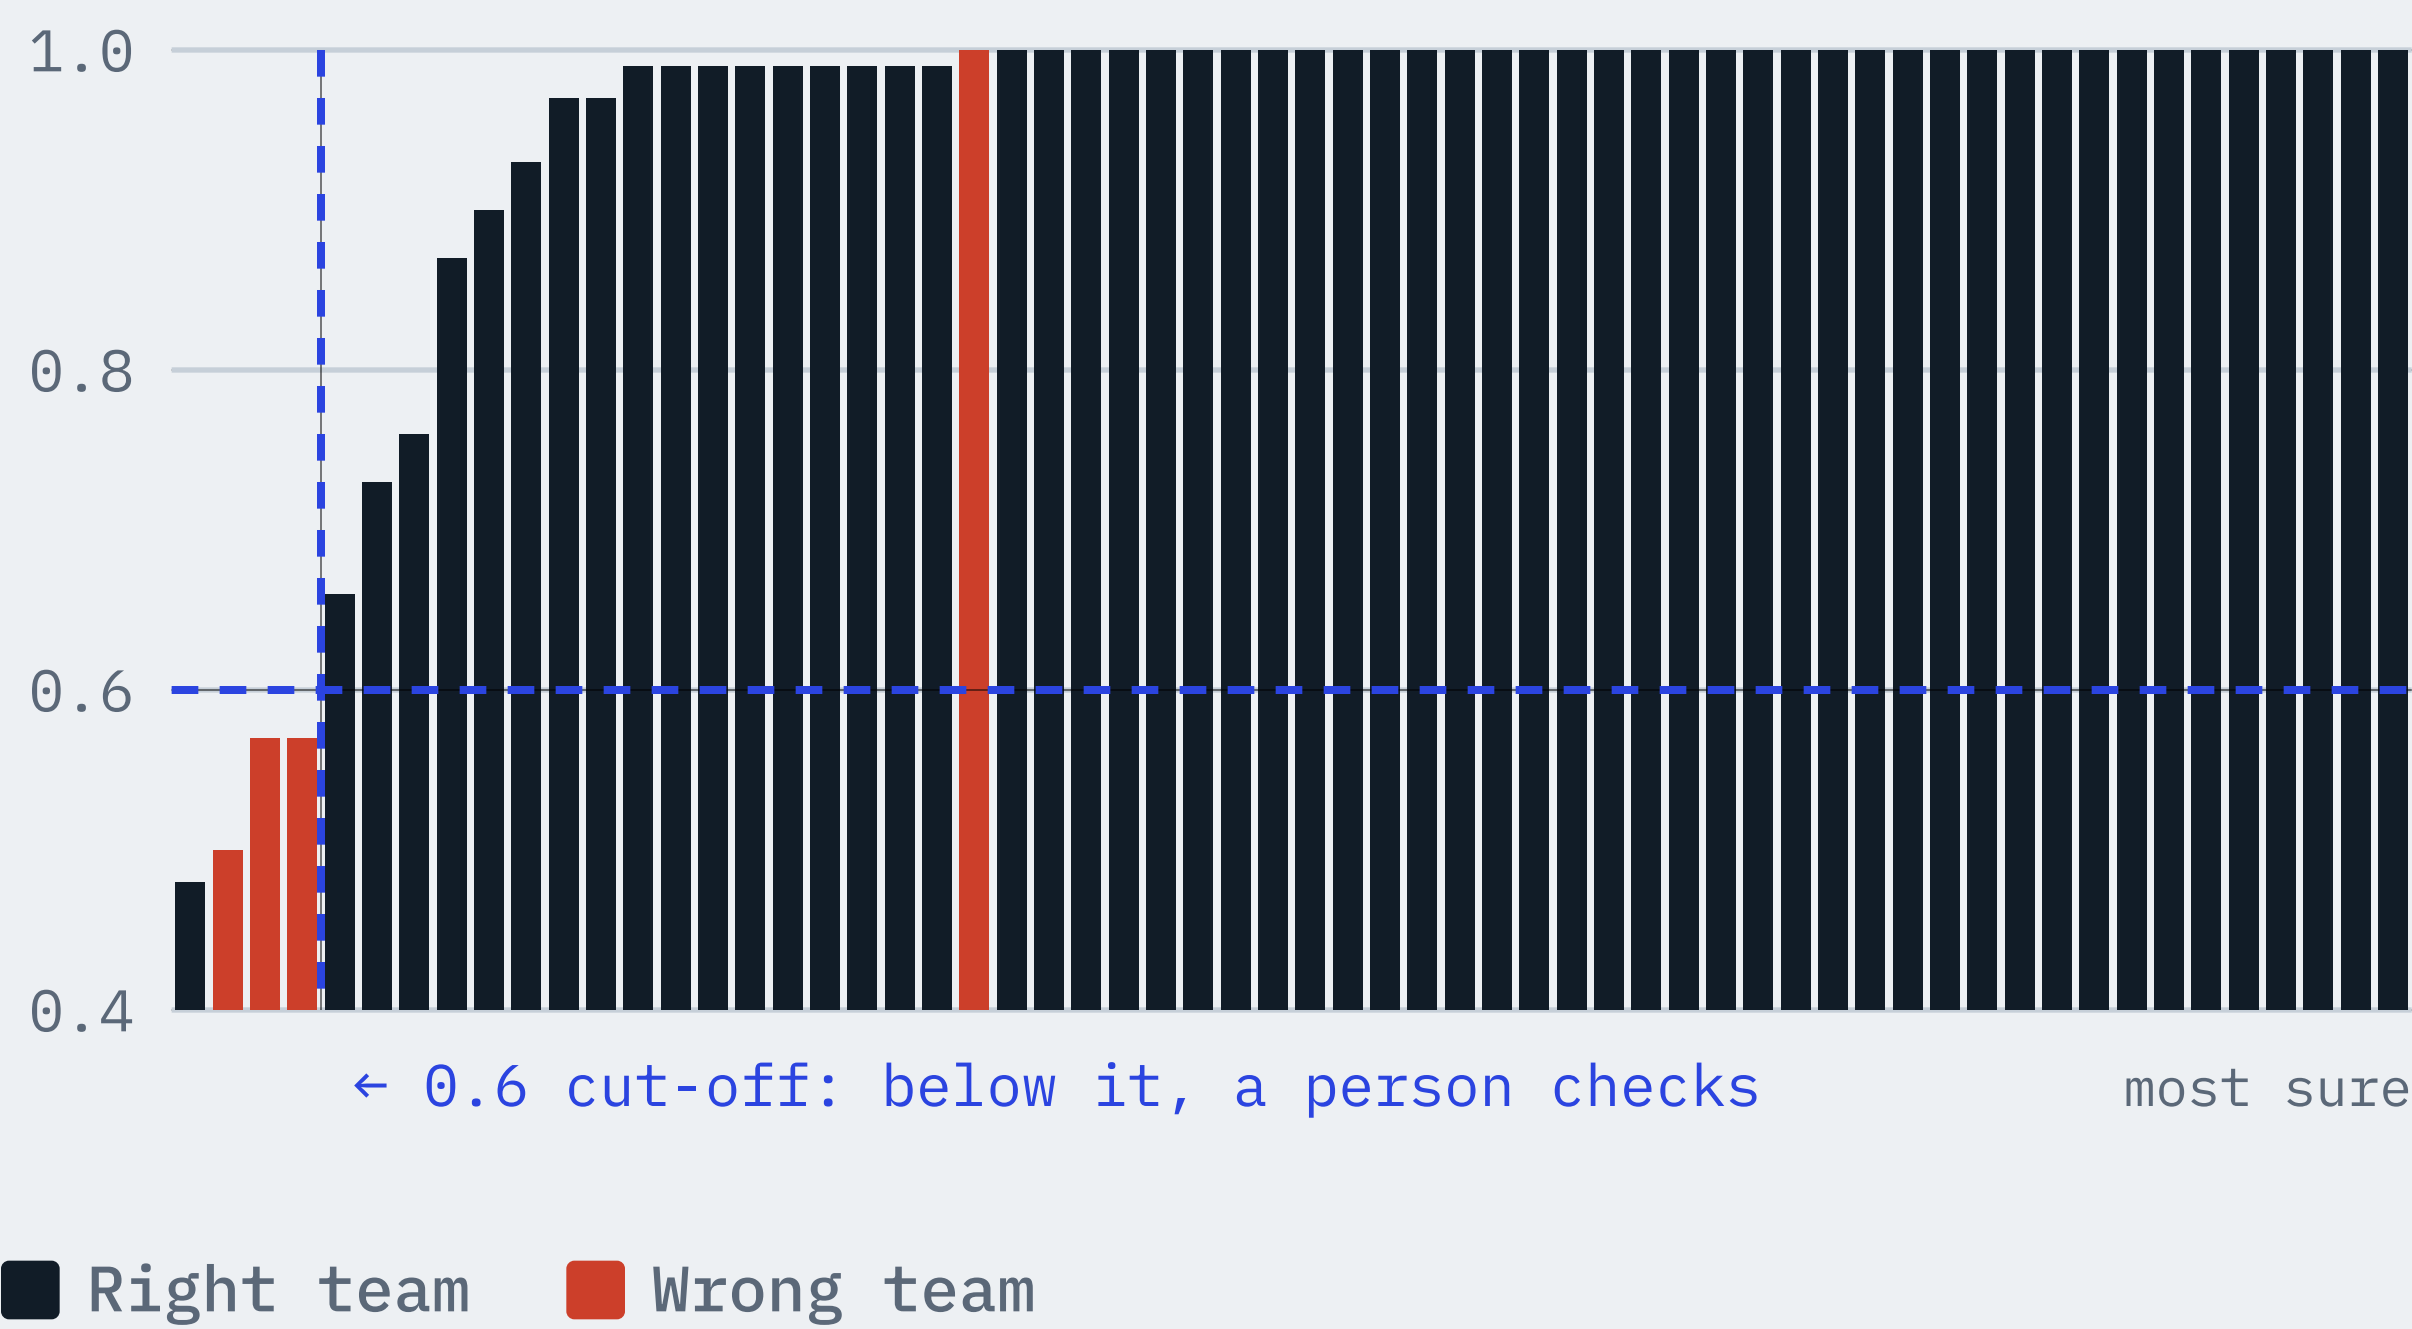

**\$0.0013**

for the whole test. About  
\$0.23 per 10,000 emails.

---

THE INTERESTING PART

# It knows when it doesn't know.

3 of 4

wrong when Jev was less than 60% sure

55 of 56

right when it was more sure than that

# Don't automate everything. Automate what it's sure about.

**60 emails**

INCOMING

Is Jev at least 60% sure?

**93%**

routed automatically.  
98% of these were right.

**7%**

go to a person.  
These were the  
genuinely unclear  
ones.

The confidence score tells you which emails a person needs to look at. You don't have to check every one.

WHERE IT SLIPPED

# All 4 mistakes. Would you have got them right?

“If you can't fix the export bug this week, please just cancel us.”

ME CANCEL JEV TECHNICAL 57% SURE

“Our CFO wants to know if there's a cheaper plan, otherwise we'll probably cancel.”

ME SALES JEV CANCEL 57% SURE

“Hi, are you the right person to talk to about outsourcing your lead generation?”

ME SPAM JEV SALES 50% SURE

“Do you accept purchase orders? Our procurement team requires one.”

ME BILLING JEV SALES 100% SURE

Three were unclear, and Jev said so. The last one is debatable: a lot of companies send procurement questions to sales.

THE BONUS FINDING

8 customers were about to leave but never wrote "cancel". Jev flagged all 8.

|                                                                                   |      |
|-----------------------------------------------------------------------------------|------|
| "Honestly the app has been down so often this month I'm looking at alternatives." | 0.87 |
| "Your competitor offered us 40% off. Can you match it?"                           | 0.76 |
| "Great product, terrible support. Been waiting 5 days on a ticket."               | 0.72 |
| "Why did my bill go from \$49 to \$79 this month??"                               | 0.68 |
| "Wow, another outage. Love paying for this. 🙄"                                    | 0.65 |

Chance of leaving, as scored by Jev. It also raised 3 false alarms out of 60, which are cheap to check.

# Three jobs it can take over today.

## ROUTING

### Sort the support inbox

Every email goes to the right team within a second of arriving.

## CHURN ALERT

### Warn account managers

Flag unhappy customers while there's still time to save them.

## PRIORITY

### Put blocked customers first

Angry and stuck customers go to the top of the queue.

The rule: **let the model decide when it's sure**, and send everything else to a person.

YOUR TURN

# What would you let it decide first?

Tell me in the comments. I'll run the best idea through Jev and share the results.

[github.com/Vipea/jev-inbox-triage](https://github.com/Vipea/jev-inbox-triage)

Code and all 60 labelled emails are open source. It's a small test (60 emails, labelled by me), so try it on your own inbox before you trust it.
